### Recent Revisions to This Document

**January 2019**

Updated "Supported Processors, Card Types, and Optional Features," page 10 to remove erroneous content regarding Vantiv.

Updated URLs for the following:

- Samsung Pay Partner Portal (see "Related Documents," page 8)
- Transaction Endpoints (see "Transaction Endpoints," page 12)
- Samsung Pay registration (see "Registering with Samsung," page 13)
- Decrypting payment credentials (see "Encrypted Payment Credential," page 22)

**July 2018**

All processors: updated information about optional features. See "Supported Processors, Card Types, and Optional Features," page 10.

**December 2017**

Added the following to the list of supported processors. See "Supported Processors, Card Types, and Optional Features," page 10:

- JCN Gateway
- Barclays
- GPN
- OmniPay Direct
- Streamline

About This Guide

Audience and Purpose

This document is written for merchants who want to enable customers to use Samsung Pay to pay for in-app purchases. This document provides an overview of integrating the Samsung Pay SDK and describes how to request the CyberSource API to process an authorization.

This document describes the Samsung Pay SDK and the CyberSource API. See "Using the Samsung Pay SDK," page 18, and "Authorizing a Payment," page 23. Merchants must use the Samsung Pay SDK to receive the customer’s encrypted payment data before requesting the CyberSource API to process the transaction.

Conventions

Notes and Important Statements

A Note contains helpful suggestions or references to material not contained in the document.

An Important statement contains information essential to successfully completing a task or learning a concept.

Requirements

Important

ProductName relies on payment network tokenization. You can sign up for ProductName only if both of the following statements are true:

- Your processor supports payment network tokenization.
- CyberSource supports payment network tokenization with your processor.

If one or both of the preceding statements are not true, you must take one of the following actions before you can sign up for ProductName:

- Obtain a new merchant account with a processor that supports payment network tokenization.
- Wait until your processor supports payment network tokenization.

You must create:

- A CyberSource account. If you do not already have a CyberSource account, contact your local CyberSource sales representative:
  
  http://www.cybersource.com/locations/

- A merchant account with a supported processor. See "Supported Processors, Card Types, and Optional Features," page 10.

Note

All optional features are described in Payment Network Tokenization Using the SCMP API.
Supported Processors, Card Types, and Optional Features

All optional features, except split shipments, are described in Payment Network Tokenization Using the SCMP API (PDF | HTML). Split shipments are described in Credit Card Services Using the SCMP API (PDF | HTML).

CHAPTER 2
Registration

Registering with Samsung

To register with Samsung:

Step 1  Create a profile by completing the merchant application on the Samsung Pay Partner Portal.

Note  Samsung will contact you if clarifications are required.

Step 2  After your merchant application is approved, you receive a unique partner ID. Include this ID in your application.

Important  You need the partner ID in order to generate the Certificate Signing Request (CSR) file in using the CyberSource Business Center. See "Registering with CyberSource," page 14. Samsung requires the CSR file in order to encrypt sensitive payment data; it contains an identifier and public key.

Step 3  Using the Samsung Pay Partner Portal, upload the CSR file.

Step 4  Enter an application name and a package name.

Step 5  When you associate the CSR file with the application, Samsung generates a product ID.

Step 6  Create login details for application developers on the Samsung Pay Partner Portal.

Step 7  Download and integrate the Samsung Pay SDK into your application. See "Using the Samsung Pay SDK," page 18.

The SDK contains:

- A Javadoc
- The Samsung Pay SDK files samsungpay.jar and sdk-v1.0.0.jar
Chapter 2  Registration

- A sample app
- The branding guide
- Image files

**Step 8** Register a Samsung account ID and request a `debug-api-key` file using the Samsung Pay Partner Portal. The `debug-api-key` file is valid for three months. See "Using the API Key," page 17.

---

*Note* The Samsung account ID, the `debug-api-key`, and the product ID are used to validate your application so that you can use the Samsung Pay SDK for testing purposes.

---

**Step 9** Submit your application for approval using the Samsung Pay Partner Portal. Upload the final version of the Android Application Package (APK) file using the Samsung Pay Partner Portal and include screenshots of your checkout page displaying the Samsung Pay logo.

---

**Registering with CyberSource**

**To register with CyberSource:**

**Step 1** Log in to the Business Center:

- Create a CSR file for live transactions: https://ebc.cybersource.com
- Create a CSR file for test transactions: https://ebctest.cybersource.com

**Step 2** Under Account Management in the left navigation panel, click Digital Payment Solutions.

**Step 3** Click **Sign Up**. Follow the steps to verify your account information and accept the ProductName Merchant Services Agreement.
Step 4  Register with CyberSource:

a  Enter your Samsung partner ID that you obtained in Step 2.

b  Click Generate CSR to generate a Certificate Signing Request (CSR) file that is associated with your Samsung partner ID.

Important

Only one CSR is permitted for each unique Samsung partner ID. If you modify your Samsung partner ID you must generate a new CSR.

c  Submit the CSR file to Samsung.
Creating a Project

To create a new project using Android Studio:

Step 1 Download Android Studio.

Step 2 Open Android Studio and click Start a new Android Studio project.

Step 3 In the New Project settings, enter the following:
- The name of your application.
- The company domain.
- To change the package name, click Edit. By default, Android Studio sets the last element of the project's package name to the name of your application.

Step 4 Click Next.

Step 5 In the Target Android Devices settings, choose the required API levels.

Step 6 Click Next.

Step 7 Choose the required activity and click Finish.
Integrating the Samsung Pay SDK

To integrate the Samsung Pay SDK:

**Step 1** Add the `samsungpay.jar` and `sdk-v1.0.0.jar` files to the `libs` folder of your Android project.

**Step 2** Choose **Gradle Scripts > build.gradle** and enter the dependencies shown below.

```gradle
dependencies {
    compile files('libs/samsungpay.jar')
    compile files('libs/sdk-v1.0.0.jar')
}
```

**Step 3** Import the package.

```java
import com.samsung.android.sdk.samsungpay;
```

Using the API Key

The API key is used to verify that your app (in debug mode or release mode) can use the Samsung Pay SDK APIs with the Samsung Pay application. To get the API key, you must create a `debug-api-key` file (Step 8) and include it in the `manifest` file.

**To use the API key:**

**Step 1** Include the API key in the `manifest` file with a custom tag. This enables the merchant app `android manifest` file to provide the `DebugMode`, `spay_debug_api_key` values as metadata.

**Example 1**  **Debug Mode**

```xml
<meta-data
    android:name="debug_mode"
    android:value="Y" />
<meta-data
    android:name="spay_debug_api_key"
    android:value="asdfggkndkeie17283094858" />
```

**Example 2**  **Release Mode**

```xml
<meta-data
    android:name="debug_mode"
    android:value="N" />
```
Eligibility

Initialize the SSamsungPay class to verify that your application is eligible for Samsung Pay and to display the Samsung Pay button to the customer (refer to branding guidelines).

The SSamsungPay class provides the following API methods:

- **initialize()**—initializes the Samsung Pay SDK and verifies eligibility for Samsung Pay, including the device, software, and business area.

  Request the initialize() API method of the SSamsungPay class before using the Samsung Pay SDK.

- **getVersionCode()**—retrieves the version number of the Samsung Pay SDK as an integer.

- **getVersionName()**—retrieves the version name of the Samsung Pay SDK as a string.

After the initialize() API method request is successful, display the Samsung Pay button to the customer.

If the initialize() API method request fails, the method displays a SsdkUnsupportedException or NullPointerException error.

- **SdkUnsupportedException**—the device is not a Samsung device or does not support the Samsung Pay package.

- **NullPointerException**—the context passed is null.
Example 3  Samsung Pay Class

```java
SSamsungPay spay = new SSamsungPay();
try {
    spay.initialize(mContext);
} catch (SsdkUnsupportedException e1) {
    e1.printStackTrace();
    pay_button.setVisibility(View.INVISIBLE);
}
```

Payment Request

Initiating a Payment

To initiate a payment:

**Step 1** Include the following fields in the `PaymentInfo` class:

- **Merchant Name**—the merchant name as it appears on the payment sheet of Samsung Pay and customer’s bank statement. This field is required.
- **Amount**—this field is required.
- **Payment Protocol**—3D Secure. This field is required.
- **Permitted Card Brands**—specify the card brands that are supported such as Visa, Mastercard, or American Express. This field is required.
- **Merchant ID**
- **Order Number**
- **Shipping Address**—this field is required if SEND_SHIPPING or NEED_BILLING_AND_SEND_SHIPPING is set for `AddressVisibilityOption`.
- **Address Visibility Option**
- **Card Holder Name**
- **Recurring Option**

If the required fields are not included, you receive a `NullPointerException` error.
Example 4  Transaction Request Structure

```java
private PaymentInfo makeTransactionDetails() {
    // Supported card brands
    ArrayList<CardInfo.Brand> brandList = new ArrayList<CardInfo.Brand>();
    if (visaBrand.isChecked())
        brandList.add(CardInfo.Brand.VISA);
    if (mcBrand.isChecked())
        brandList.add(CardInfo.Brand.Mastercard);
    if (amexBrand.isChecked())
        brandList.add(CardInfo.Brand.AMERICANEXPRESS);

    // Basic payment information
    PaymentInfo paymentReq = new PaymentInfo.Builder()
        .setMerchantId("merchantID")
        .setMerchantName("Test").setAmount(getAmount())
        .setShippingAddress(getShippingAddressInfo())
        .setOrderId(orderNoView.getText().toString())
        .setPaymentProtocol(PaymentProtocol.PROTOCOL_3DS)
        .setAddressInPaymentSheet(AddressInPaymentSheet.DO_NOT_SHOW)
        .setAllowedCardBrands(brandList) .setRecurringEnabled(isRecurring)
        .setCardHolderNameEnabled(isCardHolderNameRequired)
        .build();
    return paymentReq;
}

// Add shipping address details
private Address getShippingAddressInfo() {
    Address address = new Address.Builder()
        .setAddressee(name.getText().toString())
        .setAddressLine1(addLine1.getText().toString())
        .setAddressLine2(addline2.getText().toString())
        .setCity(city.getText().toString())
        .setState(state.getText().toString())
        .setCountryCode(country.getSelectedItem().toString())
        .setPostalCode(zip.getText().toString()).build();
    return address;
}

// Add amount details
private Amount getAmount() {
    Amount amount = new Amount.Builder()
        .setCurrencyCode(currencyType.getSelectedItem().toString())
        .setItemTotalPrice(productPrice.getText().toString())
        .setShippingPrice(shippingPrice.getText().toString())
        .setTax(taxPrice.getText().toString())
        .setTotalPrice(totalAmount.getText().toString()).build();
    return amount;
}
```
Requesting a Payment

To request a payment:

**Step 1** Use the `startSamsungPay()` API method in the `PaymentManager` class.

The `PaymentManager` class includes the following API methods:

- `startSamsungPay()` — requests to initiate payment with Samsung Pay.
- `updateAmount()` — updates the transaction amount if shipping address or card information is updated by Samsung Pay.
- `updateAmountFailed()` — returns an error code when the new amount cannot be updated because of a wrong address.

**Step 2** Request the `startSamsungPay()` API method and include the following data:

- `PaymentInfo` — the `paymentInfo` structure, which contains payment information.
- `StatusListener` — the result of the payment request is delivered to `StatusListener`. This listener should be registered before calling the `startSamsungPay()` API method.

When you request the `startSamsungPay()` API method, the Samsung Pay online payment sheet is displayed on the screen of your application. The customer selects a registered card for payment and can also update the billing and shipping address.

The payment reply is delivered as one of the following events to `StatusListener`:

- `onSuccess()` — this event is requested when Samsung Pay confirms the payment. It includes `encryptedPaymentCredential` in JSON format. See Table 2, "Encrypted Payment Credential," on page 22.

- `onFailure()` — this event is requested when the transaction fails. It returns an error code and error message.
Example 5  Request startSamsungPay() API Method

```java
public void onPayButtonClicked(View v) {
    // Call startSamsungPay() method of PaymentManager class.
    // To create a transaction request for makeTransactionDetails() in
    // the following code, see Example 4, "Transaction Request Structure,"
    // on page 20.
    try {
        mPaymentManager.startSamsungPay(makeTransactionDetails(), "enter
        product ID",
        mStatusListener);
    } catch (NullPointerException e) {
        e.printStackTrace();
    }
}
private PaymentManager.StatusListener mStatusListener = new
    PaymentManager.StatusListener() {
        @Override
        public void onFailure(int errCode, String msg) {
            Log.d(TAG, " onFailed ");
        }
        @Override
        public void onSuccess(PaymentInfo arg0, String result) {
            Log.d(TAG, "onSuccess ");
        }
    }
```

For information on how to decrypt the encrypted payment credential, see:

[https://pay.samsung.com/developers](https://pay.samsung.com/developers)
Authorizing a Payment

Merchant Decryption

Visa Transaction

To request an authorization for a Visa transaction:

Step 1 Set the `customer_cc_number` field to the payment network token value.

Step 2 Set the `customer_cc_expmo` and `customer_cc_expyr` values to the payment network token expiration date values.

Step 3 Set the `cavv` field to the 3D Secure cryptogram of the payment network token.

Step 4 Set the `network_token_cryptogram` field to the network token cryptogram.

Step 5 Set the `payment_network_token_transaction_type` field to 1.

Step 6 Set the `e_commerce_indicator` field to `internet`.

Step 7 Set the `payment_solution` field to `008`.

Note Your payment processor can include additional API reply fields that are not documented in this guide. See *Credit Card Services Using the SCMP API* (PDF | HTML) for detailed descriptions of additional API reply fields.

Note See "API Request Fields," page 40 and "API Reply Fields," page 47 for detailed field descriptions.

Mastercard Transaction

To request an authorization for a Mastercard transaction:

Step 1  Set the customer_cc_number field to the payment network token value.

Step 2  Set the customer_cc_expmo and customer_cc_expyr values to the payment network token expiration date values.

Step 3  Set the ucaf_authentication_data field to the 3D Secure cryptogram of the payment network token.

Step 4  Set the network_token_cryptogram field to the network token cryptogram.

Step 5  Set the ucaf_collection_indicator field to 2.

Step 6  Set the payment_network_token_transaction_type field to 1.

Step 7  Set the e_commerce_indicator field to spa.

Step 8  Set the payment_solution field to 008.

Note  See "API Request Fields," page 40 and "API Reply Fields," page 47 for detailed field descriptions.
Example 8  Merchant Decryption Authorization Request (Mastercard)

```

American Express Transaction

To request an authorization for an American Express transaction:

**Step 1** Set the **customer_cc_number** field to the payment network token value.

**Step 2** Set the **customer_cc_expmo** and **customer_cc_expyr** values to the payment network token expiration date values.

**Step 3** Set the **cavv** field to the 3D Secure cryptogram of the payment network token.

Include the whole 20-byte cryptogram in the **cavv** field. For a 40-byte cryptogram, split the cryptogram into two 20-byte binary values (block A and block B). Set the **cavv** field to the block A value and set the **xid** field to the block B value.

**Step 4** Set the **network_token_cryptogram** field to the network token cryptogram.

**Step 5** Set the **payment_network_token_transaction_type** field to 1.

**Step 6** Set the **e_commerce_indicator** field to aesk.

**Step 7** Set the **payment_solution** field to 008.

```
CyberSource Decryption

Visa Transaction

To request an authorization for a Visa transaction:

Step 1

Set the encrypted_payment_data field to the value that was returned from Samsung Pay in the 3ds.data block.

- Retrieve the payment data from Samsung Pay in JSON Web Encryption (JWE) format.
- Encode it in Base64.
- Retrieve the corresponding Key ID (KID) with encryption and set the values as:

```
{
    "publicKeyHash": "kid",
    "version": "100",
    "data": "encoded data from step b above"
}
```

- Encode the structure in Base64.
- Add the value to the encrypted_payment_data field.

Step 2

Set the encrypted_payment_descriptor field to Rk1EPUnptU1PTi5TQU1TVU5HLkloQVBQL1BBWU1PTiQ=.

Step 3

Set the payment_network_token_transaction_type field to 1.

Step 4

Set the e_commerce_indicator field to internet.

Step 5

Set the payment_solution field to 008.

Note

Example 14  CyberSource Decryption Authorization Request (Visa)

```
bill_address1=111 S. Division St.
bill_address2=Suite 123
bill_city=Ann Arbor

token_expirationMonth=08
token_expirationYear=2021
```
Mastercard Transaction

To request an authorization for a Mastercard transaction:

Step 1 Set the `encrypted_payment_data` field to the value that was returned from Samsung Pay in the `3ds.data` block.

  a  Retrieve the payment data from Samsung Pay in JSON Web Encryption (JWE) format.

  b  Encode it in Base64.

  c  Retrieve the corresponding Key ID (KID) with encryption and set the values as:

    ```json
    {
      "publicKeyHash": "kid",
      "version": "100",
      "data": "encoded data from step b above"
    }
    ```

    d  Encode the structure in Base64.

    e  Add the value to the `encrypted_payment_data` field.

Step 2 Set the `encrypted_payment_descriptor` field to `Rk1EPUNPTU1PTi5TQU1TVU5HLklOQVBQLlBBWU1FT1Q=`.

Step 3 Set the `payment_network_token_transaction_type` field to `1`.

Step 4 Set the `e_commerce_indicator` field to `spa`.

Step 5 Set the `payment_solution` field to `008`.

Note See "API Request Fields," page 40 and "API Reply Fields," page 47 for detailed field descriptions.

Additional CyberSource Services

Refer to Credit Card Services Using the SCMP API (PDF | HTML) for information on how to request these follow-on services.

Table 3  CyberSource Services

<table>
<thead>
<tr>
<th>CyberSource Service</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capture</td>
<td>A follow-on service that uses the request ID returned from the previous authorization. The request ID links the capture to the authorization. This service transfers funds from the customer’s account to your bank and usually takes two to four days to complete.</td>
</tr>
<tr>
<td>Sale</td>
<td>A sale is a bundled authorization and capture. Request the authorization and capture services at the same time. CyberSource processes the capture immediately.</td>
</tr>
<tr>
<td>Authorization Reversal</td>
<td>A follow-on service that uses the request ID returned from the previous authorization. An authorization reversal releases the hold that the authorization placed on the customer’s credit card funds. Use this service to reverse an unnecessary or undesired authorization.</td>
</tr>
</tbody>
</table>
Data Type Definitions

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Description</th>

| cavv                | **Visa**  
Cryptogram for payment network tokenization transactions. The value for this field must be 28-character base64 or 40-character hex binary. All cryptograms use one of these formats.  
**American Express**  
For a 20-byte cryptogram, set this field to the cryptogram for payment network tokenization transactions. For a 40-byte cryptogram, set this field to block A of the cryptogram for payment network tokenization transactions. The value for this field must be 28-character base64 or 40-character hex binary. All cryptograms use one of these formats. |
|                     | ics_auth (R)                                                               | String (40)                          |
| currency            | Currency used for the order: USD                                            | ics_auth (R)                          | String (5)         |
| customer_cc_expmo   | Two-digit month in which the payment network token expires.  
Format: MM.  
Possible values: 01 through 12. |
|                     | ics_auth (R)                                                               | String (2)                           |
| customer_cc_expyr   | Four-digit year in which the payment network token expires.  
Format: YYYY. |
|                     | ics_auth (R)                                                               | Nonnegative integer (4)              |
| customer_cc_number  | The payment network token value.  
This value is obtained by decrypting the customer’s encrypted payment data. |
|                     | ics_auth (R)                                                               | Nonnegative integer (20)             |
| customer_email      | Customer’s email address.  
**Important** It is your responsibility to determine whether a field is required for the transaction you are requesting.  
See "Relaxed Requirements for Address Data," page 39. |
|                     | ics_auth (See description)                                                 | String (255)                         |

1 The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant’s acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.
### API Request Fields (Continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Used By: Required (R) or Optional (O)</th>
<th>Data Type (Length)</th>
</tr>
</thead>
<tbody>
<tr>
<td>customer_firstname</td>
<td>Customer’s first name. For a credit card transaction, this name must match the name on the card.</td>
<td>ics_auth (See description)</td>
<td>String (60)</td>
</tr>
</tbody>
</table>

**Important** It is your responsibility to determine whether a field is required for the transaction you are requesting.

See "Relaxed Requirements for Address Data," page 39.

<table>
<thead>
<tr>
<th>customer_ipaddress</th>
<th>Customer’s IP address.</th>
<th>ics_auth (O)</th>
<th>String (15)</th>
</tr>
</thead>
</table>

| customer_lastname               | Customer’s last name. For a credit card transaction, this name must match the name on the card. | ics_auth (See description)             | String (60)        |

**Important** It is your responsibility to determine whether a field is required for the transaction you are requesting.

See "Relaxed Requirements for Address Data," page 39.

<table>
<thead>
<tr>
<th>customer_phone</th>
<th>Customer’s phone number. CyberSource recommends that you include the country code when the order is from outside the U.S.</th>
<th>ics_auth (O)</th>
<th>String (15)</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>eci_raw</th>
<th>Raw electronic commerce indicator (ECI).</th>
<th>ics_auth</th>
<th>String (2)</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>directory_server_transaction_id</th>
<th>Identifier generated during the authentication transaction by the Mastercard Directory Server and passed back with the authentication results.</th>
<th>ics_auth (O)</th>
<th>String (36)</th>
</tr>
</thead>
</table>

| e_commerce_indicator           | For a payment network tokenization transaction.                                                                 | ics_auth (O)                          | String (20)        |

Possible values:

- **aesk**: American Express card type
- **spa**: Mastercard card type
- **internet**: Visa card type

1 The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant’s acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.
### Table 4  API Request Fields (Continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Used By: Required (R) or Optional (O)</th>
<th>Data Type (Length)</th>
</tr>
</thead>
<tbody>
<tr>
<td>encrypted_payment_data</td>
<td>The encrypted payment data value. If you are using the CyberSource Decrypton option, populate this field with the encrypted payment data value returned from Samsung Pay in the 3ds.data block. See &quot;CyberSource Decryption,&quot; page 31.</td>
<td>ics_auth (R)</td>
<td></td>
</tr>
<tr>
<td>encrypted_payment_descriptor</td>
<td>Format of the encrypted payment data. The value for Samsung Pay is Rk1EPUNPTU1PTi5TQU1TVU5HLk1OQVBQLlBBWU1FTlQ=</td>
<td>ics_auth (R)</td>
<td></td>
</tr>
<tr>
<td>grand_total_amount</td>
<td>Grand total for the order. This value cannot be negative. You can include a decimal point (.), but you cannot include any other special characters. CyberSource truncates the amount to the correct number of decimal places.</td>
<td>ics_auth (R)</td>
<td>Decimal (15)</td>
</tr>
<tr>
<td>ics_applications</td>
<td>CyberSource services to process for the request: ics_auth</td>
<td>ics_auth (R)</td>
<td>String (255)</td>
</tr>
<tr>
<td>merchant_id</td>
<td>Your CyberSource merchant ID. Use the same merchant ID for evaluation, testing, and production.</td>
<td>ics_auth (R)</td>
<td>String (30)</td>
</tr>
<tr>
<td>merchant_ref_number</td>
<td>Merchant-generated order reference or tracking number. CyberSource recommends that you send a unique value for each transaction so that you can perform meaningful searches for the transaction. For information about tracking orders, see *Getting Started with CyberSource Advanced for the SCMP API (PDF</td>
<td>HTML).</td>
<td>ics_auth (R)</td>
</tr>
<tr>
<td>network_token_cryptogram</td>
<td>Token authentication verification value cryptogram. For token-based transactions with 3D Secure or SecureCode, you must submit both types of cryptograms: network token and 3D Secure/SecureCode. The value for this field must be 28-character Base64 or 40-character hex binary. All cryptograms use one of these formats.</td>
<td>ics_auth (O)</td>
<td>String (40)</td>
</tr>
</tbody>
</table>

1 The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant’s acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.
### Table 4  API Request Fields (Continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Used By: Required (R) or Optional (O)</th>
<th>Data Type (Length)</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pa_specification_version</code></td>
<td>The 3D Secure version that you used for Secured Consumer Authentication (SCA); for example, 3D Secure 1.0.2 or 2.0.0.</td>
<td>ics_auth (O)</td>
<td>String (20)</td>
</tr>
<tr>
<td><code>payment_network_token_assurance_level</code></td>
<td>Confidence level of the tokenization. This value is assigned by the token service provider. Note  This field is supported only for FDC Nashville Global.</td>
<td>ics_auth (O)</td>
<td>String (2)</td>
</tr>
<tr>
<td><code>payment_network_token_device_tech_type</code></td>
<td>Type of technology used in the device to store token data. Possible value: 002: Host card emulation (HCE) Emulation of a smart card by using software to create a virtual and exact representation of the card. Sensitive data is stored in a database that is hosted in the cloud. For storing payment credentials, a database must meet very stringent security requirements that exceed PCI DSS. Note  This field is supported only for FDC Compass.</td>
<td>ics_auth (O)</td>
<td>Integer (3)</td>
</tr>
<tr>
<td><code>payment_network_token_requestor_id</code></td>
<td>Value that identifies your business and indicates that the cardholder's account number is tokenized. This value is assigned by the token service provider and is unique within the token service provider's database. Note  This field is supported only for FDC Nashville Global and Chase Paymentech Solutions.</td>
<td>ics_auth (O)</td>
<td>Integer (1)</td>
</tr>
<tr>
<td><code>payment_network_token_transaction_type</code></td>
<td>Type of transaction that provided the token data. This value does not specify the token service provider; it specifies the entity that provided you with information about the token. Set the value for this field to 1.</td>
<td>ics_auth (R)</td>
<td>String (1)</td>
</tr>

<td>Integer (10)</td>
</tr>
<tr>
<td>tax_amount</td>
<td>Total tax to apply to the product. This value cannot be negative.</td>
<td>ics_auth (See description)</td>
<td>String (15)</td>
</tr>
</tbody>
</table>

## API Reply Fields

Because CyberSource can add reply fields, reply codes, and reply flags at any time:

- You must parse the reply data according to the names of the fields instead of the field order in the reply. For more information about parsing reply fields, see the documentation for your client.
- Your error handler should be able to process new reply codes and reply flags without problems.
- Your error handler should use the ics_rcode field to determine the result if it receives a reply flag that it does not recognize.
Your payment processor can include additional API reply fields that are not documented in this guide. See Credit Card Services Using the SCMP API (PDF | HTML) for detailed descriptions of additional API reply fields.

### Table 6  Reply Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Returned By</th>
<th>Data Type &amp; Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>auth_auth_amount</td>
<td>Amount that was authorized.</td>
<td>ics_auth</td>
<td>Decimal (15)</td>
</tr>
<tr>
<td>auth_auth_avs</td>
<td>AVS result code. See Credit Card Services Using the SCMP API (PDF</td>
<td>HTML) for a detailed list of AVS values.</td>
<td>ics_auth</td>
</tr>
<tr>
<td>auth_auth_code</td>
<td>Authorization code. Returned only when the processor returns this value.</td>
<td>ics_auth</td>
<td>String (7)</td>
</tr>
<tr>
<td>auth_auth_response</td>
<td>For most processors, this value is the error message sent directly from the bank. Returned only when the processor returns this value.</td>
<td>ics_auth</td>
<td>String (10)</td>
</tr>
<tr>
<td>auth_auth_time</td>
<td>Time of authorization in UTC. See &quot;Data Type Definitions,&quot; page 39.</td>
<td>ics_auth</td>
<td>Date and time (20)</td>
</tr>
<tr>
<td>auth_avs_raw</td>
<td>AVS result code sent directly from the processor. Returned only when the processor returns this value.</td>
<td>ics_auth</td>
<td>String (10)</td>
</tr>
<tr>
<td>authrcode</td>
<td>Indicates whether the service request was successful. Possible values:</td>
<td>ics_auth</td>
<td>Integer (1)</td>
</tr>
<tr>
<td></td>
<td>-1: An error occurred.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>0: The request was declined.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>1: The request was successful.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>authrflag</td>
<td>One-word description of the result of the entire request. See Credit Card Services Using the SCMP API (PDF</td>
<td>HTML) for a detailed list of rflag values.</td>
<td>ics_auth</td>
</tr>
<tr>
<td>authrmsg</td>
<td>Message that explains the reply flag authrflag. Do not display this message to the customer, and do not use this field to write an error handler.</td>
<td>ics_auth</td>
<td>String (255)</td>
</tr>
<tr>
<td>authtransrefno</td>
<td>Reference number for the transaction. This value is not returned for all processors.</td>
<td>ics_auth</td>
<td>String (60)</td>
</tr>
</tbody>
</table>
### Table 6  Reply Fields (Continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Returned By</th>
<th>Data Type &amp; Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>card_suffix</td>
<td>Last four digits of the cardholder’s account number. This field is returned only for tokenized transactions. You can use this value on the receipt that you give to the cardholder. This field is returned only for FDC Nashville Global.</td>
<td>ics_auth</td>
<td>String (4)</td>
</tr>
<tr>
<td>currency</td>
<td>Currency used for the order. For the possible values, see the ISO Standard Currency Codes.</td>
<td>ics_auth</td>
<td>String (5)</td>
</tr>
<tr>
<td>directory_server_transaction_id</td>
<td>Identifier generated during the authentication transaction by the Mastercard Directory Server and passed back with the authentication results.</td>
<td>pa_enroll (O)</td>
<td>String (36)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>pa_validate (O)</td>
<td></td>
</tr>
</tbody>
</table>
| ics_rcode              | Indicates whether the service request was successful. Possible values:  
  ■ -1: An error occurred.  
  ■ 0: The request was declined.  
  ■ 1: The request was successful. | ics_auth    | Integer (1)         |
<p>| ics_rflag              | One-word description of the result of the entire request. See Credit Card Services Using the SCMP API (PDF | HTML) for a detailed list of rflag values. | ics_auth    | String (50)         |
| ics_rmsg               | Message that explains the reply flag ics_rflag. Do not display this message to the customer, and do not use this field to write an error handler. | ics_auth    | String (255)        |
| merchant_ref_number    | Order reference or tracking number that you provided in the request. If you included multi-byte characters in this field in the request, the returned value might include corrupted characters. | ics_auth    | String (50)         |
| request_id             | Identifier for the request generated by the client.                        | ics_auth    | String (26)         |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
