About This Guide

Audience and Purpose

This document is written for merchants who want to use Apple Pay in an iOS application and use information from Apple to process payments through CyberSource. This document provides an overview for integrating Apple and CyberSource services into an order management system.

Conventions

Important Statements

An Important statement contains information essential to successfully completing a task or learning a concept.

http://www.cybersource.com/support
Getting Started

Requirements

- CyberSource account. If you do not already have a CyberSource account, contact your local CyberSource sales representative. You can find your local Sales office here: http://www.cybersource.com/locations/

- Merchant account with a supported processor (see Table 1, “Processors, Card Types, and Optional Features,” on page 10).

- You must have an Admin or Team Agent user of the Apple Pay Developer account.

Important

Apple Pay relies on authorizations with payment network tokens. You can sign up for Apple Pay only when both of the following statements are true:

- Your processor supports payment network tokens.
- CyberSource supports payment network tokens with your processor.

If one or both of the preceding statements are not true, you must take one of the following actions before you can sign up for Apple Pay:

- Obtain a new merchant account with a processor that supports payment network tokens.
- Wait until your processor supports payment network tokens.
## Supported Processors, Card Types, and Optional Features

All optional features, except split shipments, are described in *Authorizations with Payment Network Tokens Using the Simple Order API* (PDF | HTML). Split shipments are described in *Credit Card Services Using the Simple Order API* (PDF | HTML).

Enrolling in Apple Pay

To enroll in Apple Pay:

**Step 1** Log in to the Business Center:
- Test transactions: https://ebctest.cybersource.com/ebc2/
- Live transactions: https://ebc2.cybersource.com/ebc2/

**Step 2** On the left navigation pane, click the Payment Configuration icon.

**Step 3** Click Digital Payment Solutions. The Digital Payments page appears.

**Step 4** Click Configure. The Apple Pay Registration panel opens.
Step 5  Enter your Apple Merchant ID.

Step 6  Click **Generate New CSR**.

Step 7  To download your CSR, click the **Download** icon next to the key.

Step 8  Follow your browser's instructions to save and open the file.

Step 9  Complete the enrollment process by submitting your CSR to Apple.

Step 10  For information about adding certificates to your Apple Merchant ID, refer to the Apple Pay PassKit:

   https://developer.apple.com/documentation/passkit

---

**Important**

If you are using a CyberSource test account, you must connect to the Apple developer system and not to the Apple production system.

---

**Important**

After you complete your testing, you must create a new CSR for the CyberSource production system, and you must use that CSR for the Apple production system. Until you perform these steps, you cannot enable payments in your iOS application.

---

Step 12  Repeat Steps 1 through 10 with your CyberSource production account and the Apple production account.

---

**Generating a New CSR**

**To generate a new CSR:**

---

Step 1  Log in to the Business Center:

- Test transactions: [https://ebctest.cybersource.com/ebc2/](https://ebctest.cybersource.com/ebc2/)
- Live transactions: [https://ebc2.cybersource.com/ebc2/](https://ebc2.cybersource.com/ebc2/)

Step 2  On the left navigation pane, click the **Payment Configuration** icon.

Step 3  Click **Digital Payment Solutions**. The Digital Payments page appears.

Step 4  Click **Configure**. The Apple Pay Registration panel opens.
Step 5  To download your CSR, click the Download icon next to the key.

Step 6  Follow your browser's instructions to save and open the file.

Step 7  To edit your Apple Merchant ID, click the Edit icon. The Edit CSR panel opens.

Step 8  Modify your merchant ID as necessary and click Update.

Transaction Reports

Go to the Business Center and use the Transaction Request Report to obtain information about your transactions:

- In the Business Center, use the Transaction Search page to identify Apple transactions. You can search for transactions by date, application type, customer name, and other transaction identifiers.

- For information about the Transaction Request Report, see the Business Center Reporting User Guide (PDF | HTML)
In-App Transactions Using the CyberSource API

Merchant Decryption

1. When the customer chooses to pay with Apple Pay, you use the Apple PassKit Framework to request the encrypted payment data from Apple.

2. Apple uses the Secure Element to create a payment token (the `PKPaymentToken` structure) and encrypt the token’s payment data (the `paymentData` field of the `PKPaymentToken` structure) before it sends it to your application.

3. You forward the encrypted payment data to your order management system to decrypt. For information on decryption, see:
   
   [https://developer.apple.com/library/ios/documentation/PassKit/Reference/PaymentTokenJSON/PaymentTokenJSON.html#//apple_ref/doc/uid/TP40014929-CH8-SW1](https://developer.apple.com/library/ios/documentation/PassKit/Reference/PaymentTokenJSON/PaymentTokenJSON.html#//apple_ref/doc/uid/TP40014929-CH8-SW1)

4. Using the CyberSource API, you submit the authorization request and include the decrypted payment data. See "Option 1: Merchant Decryption," page 21.
5 CyberSource forwards the information to the payment network, including your processor and the relevant payment card company.

Important You must use the Business Center or one of the CyberSource API services to capture, credit, or void the authorization. See Credit Card Services Using the Simple Order API.

CyberSource Decryption

1 When the customer chooses to pay with Apple Pay, you use the Apple PassKit Framework to request the encrypted payment data from Apple.

2 Apple uses the Secure Element to create a payment token (the PKPaymentToken structure) and encrypt the token’s payment data (the paymentData field of the PKPaymentToken structure) before it sends it your application.

3 You forward the encrypted payment data to your order management system.

4 Using the CyberSource API, you submit the authorization request. In the encryptedPayment_data field include the Base64 encoded value obtained from the paymentData field of the PKPaymentToken structure. See "Option 2: CyberSource Decryption," page 32.

5 CyberSource decrypts the payment data and forwards the information to the payment network, including your processor and the relevant payment card company.

Important You must use the Business Center or one of the CyberSource API services to capture, credit, or void the authorization. See Credit Card Services Using the Simple Order API.
Web Transactions

Merchant Decryption

1 When the customer chooses to pay with Apple Pay, you use the Apple Pay JavaScript to request the encrypted payment data from Apple.

2 Apple uses the Secure Element to create a payment token (the PKPaymentToken structure) and encrypt the token’s payment data (the paymentData field of the PKPaymentToken structure) before it sends it your application using the onpaymentauthorized callback function.

3 You forward the encrypted payment data to your order management system to decrypt. For information on decryption, see:
   https://developer.apple.com/library/ios/documentation/PassKit/Reference/PaymentTokenJSON/PaymentTokenJSON.html#//apple_ref/doc/uid/TP40014929-CH8-SW1

4 Using the CyberSource API, you submit the authorization request and include the decrypted payment data. See "Option 2: CyberSource Decryption," page 32.

5 CyberSource forwards the information to the payment network, including your processor and the relevant payment card company.

---

You must use the Business Center or one of the CyberSource API services to capture, credit, or void the authorization. See Credit Card Services Using the Simple Order API.

CyberSource Decryption

1 When the customer chooses to pay with Apple Pay, you use the Apple Pay JavaScript to request the encrypted payment data from Apple.

2 Apple uses the Secure Element to create a payment token (the PKPaymentToken structure) and encrypt the token’s payment data (the paymentData field of the PKPaymentToken structure) before it sends it your application via the onpaymentauthorized callback function.

3 You forward the encrypted payment data to your order management system.

4 Using the CyberSource API, you submit the authorization request. In the encryptedPayment_data field include the Base64 encoded value obtained from the paymentData field of the PKPaymentToken structure. See "Option 2: CyberSource Decryption," page 32.
CyberSource decrypts the payment data and forwards the information to the payment network, including your processor and the relevant payment card company.

**Important**

You must use the Business Center or one of the CyberSource API services to capture, credit, or void the authorization. See *Credit Card Services Using the Simple Order API*.

**Requirements**

You must be an *Admin* or *Team Agent* user of your Apple Developer Program account.

For details on each requirement below, see:

**To configure your requirements:**

**Step 1**
Register your merchant ID.

If you are currently processing In-App transactions, you can use the same merchant ID for processing Web transactions.

**Step 2**
Create or upload a Certificate Signing Request (CSR), which is used to encrypt the payment information during the payment process.

If you are using the merchant decryption method (see "Option 1: Merchant Decryption," page 21), create a CSR.

If you are using the CyberSource decryption method (see "Option 2: CyberSource Decryption," page 32), upload the CSR that you created in the Business Center (see "Enrolling in Apple Pay," page 11).

If you are currently processing In-App transactions, you can use the same CSR for processing Web transactions.

**Step 3**
Register your domain. Registration is required in order to use Apple Pay on your web site.

**Step 4**
Create a Merchant Identity Certificate. This certificate is required in order to connect to the Apple servers.

All optional features are described in *Authorizations with Payment Network Tokens Using the Simple Order API* (PDF | HTML).
Apple Pay JavaScript

Use the Apple Pay JavaScript to accept Apple Pay payments on your web site. The Apple Pay JavaScript tests that Apple Pay exists on your web site, displays the Apple Pay sheet, and receives the payment token.

Apple Pay Button

When a customer clicks or taps an Apple Pay button, you must ensure that it invokes the Apple Pay payment sheet.

Important

For information on how to use Apple Pay buttons and the button styles, see: https://developer.apple.com/apple-pay/Apple-Pay-Identity-Guidelines.pdf

You can use CSS templates provided by Apple to display the Apple Pay button on your web site. There are two templates: logo only button and buy with button. For more information, see Displaying the Apple Pay Button.

ApplePaySession Class

The ApplePaySession class manages the payment process on your web site. The ApplePaySession object is the entry point for Apple Pay on your web site.

Before displaying the Apple Pay button (see "Apple Pay Button," page 18) or creating an Apple Pay session (see "Create ApplePaySession Object," page 19), ensure that the Apple Pay JavaScript API is available and enabled on the device.

To enable the Apple Pay JavaScript API:

Step 1 Verify that the window.ApplePaySession class exists.

Step 2 Call its canMakePayments or canMakePaymentsWithActiveCard method:

- canMakePayments—verifies that the device is enabled for Apple Pay.

- canMakePaymentsWithActiveCard—verifies that the device is enabled for Apple Pay and the customer has a card stored on the device. You can call this method only if Apple Pay is the default payment method during your checkout flow, or if you want to add the Apple Pay button to your product detail page.
Create ApplePaySession Object

There are two required arguments when creating an ApplePaySession object:

- Version number—the API version is 1.
- Payment request—the PaymentRequest dictionary contains the information required in order to display the payment form.

When the session is created, call its begin method to display the payment form. This method can be called only when invoked by a user’s request.

Merchant Validation

When the payment form is displayed, the onvalidatemerchant callback function is called and provides a URL to pass to your server for validating the merchant session. Refer to the Merchant Validation section.

Payment Confirmation

When the customer confirms the payment by clicking or tapping the Apple Pay button, the onpaymentauthorized callback function is called and provides the payment token.

Merchant Decryption

Forward the encrypted payment data to your order management system to decrypt. For information on decryption, see:

https://developer.apple.com/library/ios/documentation/PassKit/Reference/PaymentTokenJSON/PaymentTokenJSON.html#//apple_ref/doc/uid/TP40014929-CH8-SW1

Using the CyberSource API, submit the authorization request and include the decrypted payment data. See "Option 1: Merchant Decryption," page 21.
CyberSource Decryption

Forward the encrypted payment data to your order management system.

Using the CyberSource API, submit the authorization request. In the `encryptedPayment_data` field include the Base64-encoded value obtained from the `paymentData` object. Example 1 shows the JavaScript for obtaining this value. See “Option 2: CyberSource Decryption,” page 32.

Example 1  JavaScript for Obtaining a Base64-Encoded Value

```javascript
session.onpaymentauthorized = function (event) {

var paymentDataString = JSON.stringify(event.payment.token.paymentData);

var paymentDataBase64 = btoa(paymentDataString);

...

}
```
Option 1: Merchant Decryption

Visa Transaction

To request an authorization for a Visa transaction:

See the Relaxed Requirements for Address Data and Expiration Date page and "Request Fields," page 46, for details and field descriptions.

Step 1 Set the `card_accountNumber` field to the payment network token value.

Step 2 Set the `card_expirationMonth` and `card_expirationYear` fields to the values from the payment network token expiration date field.

Step 3 Set the `ccAuthService_cavv` field to the 3D Secure cryptogram of the payment network token.

Step 4 Set the `ccAuthService_networkTokenCryptogram` field to the network token cryptogram.

Step 5 Set the `paymentNetworkToken_transactionType` field to 1.

Step 6 Set the `ccAuthService_commerceIndicator` field to the ECI value contained in the Apple Pay response payload (5=vbv and 7=internet).

Step 7 Set the `paymentSolution` field to 001.
Example 2  Authorization Request (Visa)

```
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
  <merchantID>demomerchant</merchantID>

```

---

**Mastercard Transaction**

To request an authorization for a Mastercard transaction:

See the [Relaxed Requirements for Address Data and Expiration Date page](#) and "Request Fields," page 46, for details and field descriptions.

**Step 1** Set the `card_accountNumber` field to the payment network token value.

**Step 2** Set the `card_expirationMonth` and `card_expirationYear` fields to the values from the payment network token expiration date field.

**Step 3** Set the `ucaf_authenticationData` field to the 3D Secure cryptogram of the payment network token.

**Step 4** Set the `ccAuthService_networkTokenCryptogram` field to the network token cryptogram.

**Step 5** Set the `ucaf_collectionIndicator` field to 2.

**Step 6** Set the `paymentNetworkToken_transactionType` field to 1.
Step 7  Set the `ccAuthService_commerceIndicator` field to ECI value contained in the Apple Pay response payload.

Step 8  Set the `paymentSolution` field to 001.

Example 4  Authorization Request (Mastercard)

```xml
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
  <merchantID>demomerchant</merchantID>
  <merchantReferenceCode>demorefnnum</merchantReferenceCode>
  <billTo>
    <firstName>Jane</firstName>
    <lastName>Smith</lastName>
    <street1>123 Main Street</street1>
    <city>Small Town</city>
    <state>CA</state>
    <postalCode>98765</postalCode>
    <country>US</country>
    <email>jsmith@example.com</email>
  </billTo>

```

American Express Transaction

To request an authorization for an American Express transaction:

See the Relaxed Requirements for Address Data and Expiration Date page and "Request Fields," page 46, for details and field descriptions.

**Step 1**  Set the `card_accountNumber` field to the payment network token value.

**Step 2**  Set the `card_expirationMonth` and `card_expirationYear` fields to the values from the payment network token expiration date field.

**Step 3**  Set the `ccAuthService_cavv` field to the 3D Secure cryptogram of the payment network token.

**Important**  Include the whole 20-byte cryptogram in the `ccAuthService_cavv` field. For a 40-byte cryptogram, split the cryptogram into two 20-byte binary values (block A and block B). Set the `ccAuthService_cavv` field to the block A value and set the `ccAuthService_xid` field to the block B value.

**Step 4**  Set the `ccAuthService_networkTokenCryptogram` field to the network token cryptogram.
Step 5 Set the `paymentNetworkToken_transactionType` field to 1.

Step 6 Set the `ccAuthService_commerceIndicator` field to ECI value contained in the Apple Pay response payload.

Step 7 Set the `paymentSolution` field to 001.

Example 6 Authorization Request (American Express)

```xml
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
  <merchantID>demomerchant</merchantID>
  <merchantReferenceCode>demorefnum</merchantReferenceCode>
  <billTo>
    <firstName>Jane</firstName>
    <lastName>Smith</lastName>
    <street1>123 Main Street</street1>
    <city>Small Town</city>
    <state>CA</state>
    <postalCode>98765</postalCode>
    <country>US</country>
    <email>jsmith@example.com</email>
  </billTo>
  <purchaseTotals>
    <currency>USD</currency>
    <grandTotalAmount>5.00</grandTotalAmount>
  </purchaseTotals>
  <card>
    <accountNumber>3782824631xxxx</accountNumber>
    <expirationMonth>12</expirationMonth>
    <expirationYear>2020</expirationYear>
    <cvNumber>123</cvNumber>
    <cardType>003</cardType>
  </card>
  <ccAuthService run="true">
    <cavv>ABCDEFabcdefABCDEFabcdef0987654321234567</cavv>
    <commerceIndicator>aesk</commerceIndicator>
  </ccAuthService>
  <paymentNetworkToken>
    <transactionType>1</transactionType>
  </paymentNetworkToken>
  <paymentSolution>001</paymentSolution>
</requestMessage>
```
Chapter 3  Requesting the Authorization Service

Example 7  Authorization Response (American Express)

```
<c:replyMessage>
  <c:requestID>4465840340765000001541</c:requestID>
  <c:decision>ACCEPT</c:decision>
  <c:reasonCode>100</c:reasonCode>
  <c:requestToken>Ahj/7wSR5C/4Icd2fdAKakGLadfg5535r/ghx3Z90AoBj3u</c:requestToken>

</c:replyMessage>
```

---

Discover Transaction

To request an authorization for a Discover transaction:

See the Relaxed Requirements for Address Data and Expiration Date page and "Request Fields," page 46, for details and field descriptions.

**Step 1**  Set the `card_accountNumber` field to the payment network token value.

**Step 2**  Set the `card_expirationMonth` and `card_expirationYear` fields to the values from the payment network token expiration date field.

**Step 3**  Set the `ccAuthService_cavv` field to the 3D Secure cryptogram of the payment network token.

**Step 4**  Set the `ccAuthService_networkTokenCryptogram` field to the network token cryptogram.

**Step 5**  Set the `paymentNetworkToken_transactionType` field to 1.

**Step 6**  Set the `ccAuthService_commerceIndicator` field to ECI value contained in the Apple Pay response payload.
**Step 7** Set the **paymentSolution** field to 001.

**Example 8** Authorization Request (Discover)

```xml
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
  <merchantID>demomerchant</merchantID>
  <merchantReferenceCode>demorefnum</merchantReferenceCode>
  <billTo>
    <firstName>Jane</firstName>
    <lastName>Smith</lastName>
    <street1>123 Main Street</street1>
    <city>Small Town</city>
    <state>CA</state>
    <postalCode>98765</postalCode>
    <country>US</country>
    <email>jsmith@example.com</email>
  </billTo>
  <purchaseTotals>
    <currency>USD</currency>
    <grandTotalAmount>5.00</grandTotalAmount>
  </purchaseTotals>
  <card>
    <accountNumber>601111111111xxxx</accountNumber>
    <expirationMonth>12</expirationMonth>
    <expirationYear>2020</expirationYear>

### JCB Transaction

To request an authorization for a JCB transaction:

See the Relaxed Requirements for Address Data and Expiration Date page and "Request Fields," page 46, for details and field descriptions.

**Step 1** Set the `card_accountNumber` field to the payment network token value.

**Step 2** Set the `card_expiration_Month` and `card_expirationYear` fields to the values from the payment network token expiration date field.

**Step 3** Set the `ccAuthService_cavv` field to the 3D Secure cryptogram of the payment network token.

**Step 4** Set the `paymentNetworkToken_transactionType` field to 1.

**Step 5** Set the `ccAuthService_eciRaw` field to the ECI value contained in the Apple Pay response payload.

**Step 6** Set the `PaymentSolution` field to 001.
Example 10  Authorization Request (JCB)

```xml
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
    <merchantID>demomerchant</merchantID>
    <merchantReferenceCode>demorefnum</merchantReferenceCode>
    <billTo>
        <firstName>Jane</firstName>
        <lastName>Smith</lastName>
        <street1>123 Main Street</street1>
        <city>Small Town</city>
        <state>CA</state>
        <postalCode>98765</postalCode>
        <country>US</country>
        <email>jsmith@example.com</email>
    </billTo>
    <purchaseTotals>
        <currency>USD</currency>
        <grandTotalAmount>5.00</grandTotalAmount>
    </purchaseTotals>
    <card>
        <accountNumber>356611111111xxxx</accountNumber>
        <expirationMonth>12</expirationMonth>
        <expirationYear>2020</expirationYear>
        <cvNumber>123</cvNumber>
        <cardType>001</cardType>
    </card>
    <ccAuthService run="true">
        <cavv>ABCDEFabcdefABCDEFabcdef0987654321234567</cavv>
        <eciRaw>5</eciRaw>
    </ccAuthService>
    <paymentNetworkToken>
        <transactionType>1</transactionType>
    </paymentNetworkToken>
    <paymentSolution>001</paymentSolution>
</requestMessage>
```
Example 11  Authorization Reply (JCB)

```xml
<c:replyMessage>
  <c:requestID>4465840340765000001541</c:requestID>
  <c:decision>ACCEPT</c:decision>
  <c:reasonCode>100</c:reasonCode>

```

Option 2: CyberSource Decryption

Visa Transaction

To request an authorization for a Visa transaction:

See the Relaxed Requirements for Address Data and Expiration Date page and "Request Fields," page 46, for details and field descriptions.

**Step 1**  Set the `encryptedPayment_data` field to the Base64-encoded value obtained from the `paymentData` property of the `PKPaymentToken` object. See "CyberSource Decryption," page 15.

**Step 2**  Set the `encryptedPayment_descriptor` field to:
Rk1EPUNPTU1PTi5BUFBMRS5JTkFQUC5QQV1NRU5U

**Step 3**  Set the `paymentSolution` field to 001.
Example 14  Authorization Request (Visa)

```xml
:requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
  <merchantID>demomerchant</merchantID>
  <merchantReferenceCode>demorefnum</merchantReferenceCode>
  <billTo>
    <firstName>Jane</firstName>
    <lastName>Smith</lastName>
    <street1>123 Main Street</street1>
    <city>Small Town</city>
    <state>CA</state>
    <postalCode>98765</postalCode>
    <country>US</country>
    <email>jsmith@example.com</email>
  </billTo>
  <purchaseTotals>
    <currency>USD</currency>
    <grandTotalAmount>5.00</grandTotalAmount>
  </purchaseTotals>
  <encryptedPayment>
    <descriptor>RklEPUNPTU1PTi5BUFBMRS5JTkFQUC5QQVlNRU5U</descriptor>
    <data>ABCDEFabcdefABCDEFabcdef0987654321234567</data>
    <encoding>Base64</encoding>
  </encryptedPayment>
  <card>
    <cardType>001</cardType>
  </card>
</requestMessage>
```
Example 15   Authorization Response (Visa)

```xml
<c:replyMessage>
  <c:requestID>4465840340765000001541</c:requestID>
  <c:decision>ACCEPT</c:decision>
  <c:reasonCode>100</c:reasonCode>
  <c:requestToken>Ahj/7wSR5C/4Icd2fdAKakGLadfg5535r/ghx3290AoBj3u</c:requestToken>
  <c:token>
    <c:expirationMonth>07</c:expirationMonth>
    <c:expirationYear>2025</c:expirationYear>
    <c:prefix>239845</c:prefix>
    <c:suffix>2947</c:suffix>
  </c:token>
  <c:purchaseTotals>
    <c:currency>USD</c:currency>
  </c:purchaseTotals>
  <c:ccAuthReply>
    <c:reasonCode>100</c:reasonCode>
    <c:amount>5.00</c:amount>
    <c:authorizationCode>888888</c:authorizationCode>
    <c:avsCode>X</c:avsCode>
    <c:avsCodeRaw>I1</c:avsCodeRaw>
    <c:authorizedDateTime>2015-11-03T20:53:54Z</c:authorizedDateTime>
    <c:processorResponse>100</c:processorResponse>
    <c:reconciliationID>11267051CGJSMQDC</c:reconciliationID>
  </c:ccAuthReply>
</c:replyMessage>
```
Mastercard Transaction

To request an authorization for a Mastercard transaction:

See the Relaxed Requirements for Address Data and Expiration Date Page and "Request Fields," page 46, for details and field descriptions.

Step 1 Set the encryptedPayment_data field to the Base64-encoded value obtained from the paymentData property of the PKPaymentToken object. See "CyberSource Decryption," page 15.

Step 2 Set the encryptedPayment_descriptor field to:
Rk1EPUNPTU1PTi5BUFBMRS5JTkFQUC5QQV1NRU5U

Step 3 Set the paymentSolution field to 001.

Example 16 Authorization Request (Mastercard)

```xml
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
  <merchantID>demomerchant</merchantID>
  <merchantReferenceCode>demorefnum</merchantReferenceCode>
  <billTo>
    <firstName>Jane</firstName>
    <lastName>Smith</lastName>
    <street1>123 Main Street</street1>
    <city>Small Town</city>
    <state>CA</state>
    <postalCode>98765</postalCode>
    <country>US</country>
    <email>jsmith@example.com</email>
  </billTo>
  <purchaseTotals>
    <currency>USD</currency>
    <grandTotalAmount>5.00</grandTotalAmount>
  </purchaseTotals>
  <encryptedPayment>
    <descriptor>Rk1EPUNPTU1PTi5BUFBMRS5JTkFQUC5QQV1NRU5U</descriptor>
    <data>ABCDEFabcdefABCDEFabcdef0987654321234567</data>
    <encoding>Base64</encoding>
  </encryptedPayment>
  <card>
    <cardType>002</cardType>
  </card>
  <ccAuthService run="true"/>
  <paymentSolution>001</paymentSolution>
</requestMessage>
```
Example 17  Authorization Response (Mastercard)

<c:replyMessage>
  <c:requestID>4465840340765000001541</c:requestID>
  <c:decision>ACCEPT</c:decision>
  <c:reasonCode>100</c:reasonCode>
  <c:requestToken>Ahj/7wSR5C/4Icd2fdAKakGLadfg5535r/ghx3Z90AoBj3u</c:requestToken>
  <c:token>
    <c:expirationMonth>07</c:expirationMonth>
    <c:expirationYear>2025</c:expirationYear>
    <c:prefix>239845</c:prefix>
    <c:suffix>2947</c:suffix>

  </c:ccAuthReply>
</c:replyMessage>
American Express Transaction

To request an authorization for an American Express transaction:

See the Relaxed Requirements for Address Data and Expiration Date page and "Request Fields," page 46, for details and field descriptions.

**Step 1** Set the `encryptedPayment_data` field to the Base64-encoded value obtained from the `paymentData` property of the `PKPaymentToken` object. See "CyberSource Decryption," page 15.

**Step 2** Set the `encryptedPayment_descriptor` field to:

```
RklEPUNPTU1PTi5BUFBMRS5JTkFQUC5QQVlNRU5U
```

**Step 3** Set the `paymentSolution` field to 001.

**Example 18 Authorization Request (American Express)**

```xml
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
  <merchantID>demomerchant</merchantID>
  <merchantReferenceCode>demorefnum</merchantReferenceCode>
  <billTo>
    <firstName>Jane</firstName>
    <lastName>Smith</lastName>
    <street1>123 Main Street</street1>
    <city>Small Town</city>
    <state>CA</state>
    <postalCode>98765</postalCode>
    <country>US</country>
    <email>jsmith@example.com</email>
  </billTo>
  <purchaseTotals>
    <currency>USD</currency>
    <grandTotalAmount>5.00</grandTotalAmount>
  </purchaseTotals>
  <encryptedPayment>
    <descriptor>RklEPUNPTU1PTi5BUFBMRS5JTkFQUC5QQVlNRU5U</descriptor>
    <data>ABCDEFabcdefABCDEFabcdef0987654321234567</data>
    <encoding>Base64</encoding>
  </encryptedPayment>
  <card>
    <cardType>003</cardType>
  </card>
  <ccAuthService run="true"/>
  <paymentSolution>001</paymentSolution>
</requestMessage>
```
Example 19  Authorization Response (American Express)

```xml
<replyMessage>
  <merchantReferenceCode>demorefnum</merchantReferenceCode>
  <requestID>4465840340765000001541</requestID>
  <decision>ACCEPT</decision>
  <reasonCode>100</reasonCode>

</replyMessage>
```
Discover Transaction

To request an authorization for a Discover transaction:

See the Relaxed Requirements for Address Data and Expiration Date Date page and "Request Fields," page 46, for details and field descriptions.

**Step 1** Set the `encryptedPayment_data` field to the Base64-encoded value obtained from the `paymentData` property of the `PKPaymentToken` object. See "CyberSource Decryption," page 15.

**Step 2** Set the `encryptedPayment_descriptor` field to:

```
RkJEPUNPTU1PTi5BUFBMRS5JTkFQUC5QQVlNRU5U
```

**Step 3** Set the `paymentSolution` field to 001.

Example 20 Authorization Request (Discover)

```xml
:requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
  <merchantID>demomerchant</merchantID>
  <merchantReferenceCode>demorefnum</merchantReferenceCode>
  <billTo>
    <firstName>Jane</firstName>
    <lastName>Smith</lastName>
    <street1>123 Main Street</street1>
    <city>Small Town</city>
    <state>CA</state>
    <postalCode>98765</postalCode>
    <country>US</country>
    <email>jsmith@example.com</email>
  </billTo>

**JCB Transaction**

**To request an authorization for a JCB transaction:**

See the Relaxed Requirements for Address Data and Expiration Date page and "Request Fields," page 46, for details and field descriptions.

**Step 1**  Set the `encryptedPayment_data` field to the Base64-encoded value obtained from the `paymentData` property of the `PKPaymentToken` object.

**Step 2**  Set the `encryptedPaymentDescriptor` field to `Rk1EPUNPTU1PTi5BUFBMRS5JTkFQUC5QQV1NRU5U`.

**Step 3**  Set the `paymentSolution` field to 001.
Example 22  Authorization Request (JCB)

```xml
<requestMessage xmlns="urn:schemas-cybersource-com:transaction-data-1.121">
  <merchantID>demomerchant</merchantID>
  <merchantReferenceCode>demorefnum</merchantReferenceCode>
  <billTo>
    <firstName>Jane</firstName>
    <lastName>Smith</lastName>
    <street1>123 Main Street</street1>
    <city>Small Town</city>
    <state>CA</state>
    <postalCode>98765</postalCode>
    <country>US</country>
    <email>jsmith@example.com</email>
  </billTo>
  <purchaseTotals>
    <currency>USD</currency>
    <grandTotalAmount>5.00</grandTotalAmount>
  </purchaseTotals>
  <encryptedPayment>
    <descriptor>RklEPUNPT1PTi5BUFBMRS5JTkFQU5QV1NRU5U</descriptor>
    <data>ABCDEFabcdefABCDEFabcdef0987654321234567</data>
    <encoding>Base64</encoding>
  </encryptedPayment>
  <card>
    <cardType>001</cardType>
  </card>
  <ccAuthService run="true"/>
  <paymentSolution>001</paymentSolution>
</requestMessage>
```
Example 23  Authorization Reply (JCB)

```xml
<c:replyMessage>
  <c:requestID>4465840340765000001541</c:requestID>
  <c:decision>ACCEPT</c:decision>
  <c:reasonCode>100</c:reasonCode>
  <c:requestToken>
    Ahj/7wSR5C/4Icd2fdAKakGLadfg5535r/ghx3Z90AoBj3u
  </c:requestToken>
  <c:token>
    <c:expirationMonth>07</c:expirationMonth>
    <c:expirationYear>2025</c:expirationYear>
    <c:prefix>239845</c:prefix>
    <c:suffix>2947</c:suffix>
  </c:token>
  <c:purchaseTotals>
    <c:currency>USD</c:currency>
  </c:purchaseTotals>
  <c:ccAuthReply>
    <c:reasonCode>100</c:reasonCode>
    <c:amount>5.00</c:amount>
    <c:authorizationCode>888888</c:authorizationCode>
    <c:avsCode>X</c:avsCode>
    <c:avsCodeRaw>I1</c:avsCodeRaw>
    <c:processorResponse>100</c:processorResponse>
    <c:reconciliationID>11267051CGJSMQDC</c:reconciliationID>
  </c:ccAuthReply>
</c:replyMessage>
```
Additional CyberSource Services

For information on how to request these follow-on services, refer to Credit Card Services Using the Simple Order API.

Table 2  CyberSource Services

<table>
<thead>
<tr>
<th>CyberSource Service</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capture</td>
<td>A follow-on service that uses the request ID returned from the previous authorization. The request ID links the capture to the authorization. This service transfers funds from the customer’s account to your bank and usually takes two to four days to complete.</td>
</tr>
<tr>
<td>Sale</td>
<td>A sale is a bundled authorization and capture. Request the authorization and capture services at the same time. CyberSource processes the capture immediately.</td>
</tr>
<tr>
<td>Auth Reversal</td>
<td>A follow-on service that uses the request ID returned from the previous authorization. An auth reversal releases the hold that the authorization placed on the customer’s credit card funds. Use this service to reverse an unnecessary or undesired authorization.</td>
</tr>
</tbody>
</table>
API Fields

Data Type Definitions

For more information about these data types, see the World Wide Web Consortium (W3C) XML Schema Part 2: Datatypes Second Edition.

Table 3  Data Type Definitions

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date and time</td>
<td>Format is YYYY-MM-DDThh:mm:ssZ, where:</td>
</tr>
<tr>
<td></td>
<td>- T separates the date and the time</td>
</tr>
<tr>
<td></td>
<td>- Z indicates Coordinated Universal Time (UTC), also known as Greenwich Mean Time (GMT)</td>
</tr>
<tr>
<td>Integer</td>
<td>Whole number {..., -3, -2, -1, 0, 1, 2, 3, ...}</td>
</tr>
<tr>
<td>String</td>
<td>Sequence of letters, numbers, spaces, and special characters</td>
</tr>
</tbody>
</table>

Numbered Elements

The CyberSource XML schema includes several numbered elements. You can include these complex elements more than once in a request. For example, when a customer order includes more than one item, you must include multiple <item> elements in your request. Each item is numbered, starting with 0. The XML schema uses an id attribute in the item’s opening tag to indicate the number. For example:

=item id="0"

As a name-value pair field name, this tag is called item_0. In this portion of the field name, the underscore before the number does not indicate hierarchy in the XML schema. The item fields are generically referred to as item_#{element name} in the documentation.
Below is an example of the numbered `<item>` element and the corresponding name-value pair field names. If you are using the Simple Object Access Protocol (SOAP), the client contains a corresponding `Item` class.

**Example 24 Numbered XML Schema Element Names and Name-Value Pair Field Names**

<table>
<thead>
<tr>
<th>XML Schema Element Names</th>
<th>Corresponding Name-Value Pair Field Names</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;item id=&quot;0&quot;&gt;</code></td>
<td><code>item_0_unitPrice</code></td>
</tr>
<tr>
<td><code>&lt;unitPrice&gt;</code></td>
<td><code>item_0_unitPrice</code></td>
</tr>
<tr>
<td><code>&lt;quantity&gt;</code></td>
<td><code>item_0_quantity</code></td>
</tr>
<tr>
<td><code>&lt;/item&gt;</code></td>
<td></td>
</tr>
<tr>
<td><code>&lt;item id=&quot;1&quot;&gt;</code></td>
<td><code>item_1_unitPrice</code></td>
</tr>
<tr>
<td><code>&lt;unitPrice&gt;</code></td>
<td><code>item_1_unitPrice</code></td>
</tr>
<tr>
<td><code>&lt;quantity&gt;</code></td>
<td><code>item_1_quantity</code></td>
</tr>
<tr>
<td><code>&lt;/item&gt;</code></td>
<td></td>
</tr>
</tbody>
</table>

When a request is in XML format and includes an `<item>` element, the element must include an `id` attribute. For example: `<item id="0">`.

**Important**

**Relaxed Requirements for Address Data and Expiration Date**

To enable relaxed requirements for address data and expiration date, contact CyberSource Customer Support to have your account configured for this feature. For details about relaxed requirements, see the Relaxed Requirements for Address Data and Expiration Date page.
# Request Fields

Unless otherwise noted, all field names are case sensitive and all fields accept special characters such as @, #, and %.

## Table 4 Request Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Used By: Required (R) or Optional (O)</th>
<th>Data Type (Length)</th>
</tr>
</thead>
<tbody>
<tr>
<td>billTo_city</td>
<td>City of the billing address.</td>
<td>ccAuthService (R)</td>
<td>String (50)</td>
</tr>
<tr>
<td>billTo_country</td>
<td>Country of the billing address. Use the two-character ISO Standard Country Codes.</td>
<td>ccAuthService (R)</td>
<td>String (2)</td>
</tr>
<tr>
<td>billTo_email</td>
<td>Customer's email address.</td>
<td>ccAuthService (R)</td>
<td>String (255)</td>
</tr>
<tr>
<td>billTo_firstName</td>
<td>Customer’s first name. For a credit card transaction, this name must match the name on the card.</td>
<td>ccAuthService (R)</td>
<td>String (60)</td>
</tr>
<tr>
<td>billTo_lastName</td>
<td>Customer’s last name. For a credit card transaction, this name must match the name on the card.</td>
<td>ccAuthService (R)</td>
<td>String (60)</td>
</tr>
<tr>
<td>billTo_phoneNumber</td>
<td>Customer’s phone number. CyberSource recommends that you include the country code when the order is from outside the U.S.</td>
<td>ccAuthService (O)</td>
<td>String (15)</td>
</tr>
<tr>
<td>billTo_postalCode</td>
<td>Postal code for the billing address. The postal code must consist of 5 to 9 digits. When the billing country is the U.S., the 9-digit postal code must follow this format: [5 digits][dash][4 digits] <strong>Example</strong> 12345-6789 When the billing country is Canada, the 6-digit postal code must follow this format: [alpha][numeric][alpha][space] [numeric][alpha][numeric] <strong>Example</strong> A1B 2C3</td>
<td>ccAuthService (R)</td>
<td>String (9)</td>
</tr>
</tbody>
</table>

1 The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant’s acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.

2 This field is optional if your CyberSource account is configured for relaxed requirements for address data and expiration date. See “Relaxed Requirements for Address Data and Expiration Date,” page 45. **Important** It is your responsibility to determine whether a field is required for the transaction you are requesting.
### Table 4 Request Fields (Continued)

1. The TC 33 Capture file contains information about the purchases and refunds that a merchant submits to CyberSource. CyberSource through VisaNet creates the TC 33 Capture file at the end of the day and sends it to the merchant's acquirer, who uses this information to facilitate end-of-day clearing processing with payment card companies.

2. This field is optional if your CyberSource account is configured for relaxed requirements for address data and expiration date. See "Relaxed Requirements for Address Data and Expiration Date," page 45. **Important** It is your responsibility to determine whether a field is required for the transaction you are requesting.
Appendix A

API Fields

## Reply Fields

Because CyberSource can add reply fields and reason codes at any time:

- You must parse the reply data according to the names of the fields instead of the field order in the reply. For more information about parsing reply fields, see the documentation for your client.
- Your error handler should be able to process new reason codes without problems.
- Your error handler should use the `decision` field to determine the result if it receives a reply flag that it does not recognize.

Your payment processor can include additional API reply fields that are not documented in this guide. See *Credit Card Services Using the Simple Order API* for detailed descriptions of additional API reply fields.

### Table 5  Reply Fields

| ccAuthReply_paymentCardService | Mastercard service that was used for the transaction. Mastercard provides this value to CyberSource. Possible value: 53: Mastercard card-on-file token service  
**Note** This field is returned only for CyberSource through VisaNet.                                                                                                                                                                                                                       | ccAuthReply | String (2)         |
| ccAuthReply_paymentCardService_result | Result of the Mastercard card-on-file token service. Mastercard provides this value to CyberSource. Possible values:  
- C: Service completed successfully.  
- F: One of the following:  
  - Incorrect Mastercard POS entry mode. The Mastercard POS entry mode should be 81 for an authorization or authorization reversal.  
  - Incorrect Mastercard POS entry mode. The Mastercard POS entry mode should be 01 for a tokenized request.  
  - Token requestor ID is missing or formatted incorrectly.  
- I: One of the following:  
  - Invalid token requestor ID.  
  - Suspended or deactivated token.  
  - Invalid token (not in mapping table).  
- T: Invalid combination of token requestor ID and token.  
- U: Expired token.  
- W: Primary account number (PAN) listed in electronic warning bulletin.  
**Note** This field is returned only for CyberSource through VisaNet.                                                                                                                                                                                                                       | ccAuthReply | String (1)         |
